

Proving the numbers with Explainable AI.

XimTier is a Decision Intelligence engine. Using a Reverse What-If algorithm and SHAP-based mathematical evidence, it automatically answers the "**why**" and "**by how much**" of business decisions — on the in-house structured data that LLMs cannot touch.

CONFIDENTIAL

Executive Summary — The Problem and the Market

XimTier works on the structured business data ChatGPT cannot handle. It goes beyond regression to automatically reverse-solve *"how much must each variable change to hit the target"*, and attaches SHAP-based mathematical evidence to every decision line. With the EU AI Act and Korea's AI Framework Act taking effect in 2026, explainability becomes a legal obligation for high-risk AI.

One-line definition. XimTier is a Decision Intelligence engine that proves the "why" and "by how much" of decisions using in-house data that LLMs cannot process. Regression analysis answers only *"what influences the outcome"*; Reverse What-If answers *"how do we reach the goal"* — as an optimal value per variable.

The Problem — ChatGPT's Ceiling Meets Regulatory Pressure

1. LLMs cannot solve in-house structured data

In finance, manufacturing, public sector and healthcare, internal data (transaction logs, process data, patient records) cannot be uploaded to an external LLM without violating policy. Yet BI tools (Tableau, Power BI) stop at regression — they never tell you *how much* to change.

2. The limit of regression — it never answers "how"

You may know that *"raising process temperature by 1°C lowers the defect rate by 0.2pp."* But *"to reach a target defect rate of 1.2%, how much must each of the five variables change?"* has no answer. Every decision collapses back into intuition plus post-hoc analysis.

3. Regulation — explainability is now mandatory

The **EU AI Act** (in force 2026) requires high-risk AI to submit per-variable contribution and mathematical evidence. Korea's **AI Framework Act** follows the same direction in H2 2026. A black-box model must be discarded entirely once a dispute arises.

4. Data sovereignty — external calls are not an option

For finance, healthcare, defense and public agencies, calling an external API is a security-policy violation. On-premise deployment with network isolation is a hard requirement — which automatically disqualifies any solution dependent on Foundation Model APIs.

Why now. 2026 is the one window in which three forces land simultaneously: ① the EU AI Act takes effect, ② Korea's AI Framework Act follows, and ③ Korea's NIPA SaaS support program runs. A solution that already has explainability built in will either become the standard within six months — or disappear.

The Reverse What-If Decision Engine

XimTier goes past regression and answers the "how" of a decision by solving backwards. Three algorithmic layers work in combination.

① WhatDataAI

Automatically identifies the 5–8 core variables in your in-house data. Analyzes missing values, outliers and time-series characteristics, then normalizes everything into a trainable form.

② Reverse What-If

Enter a target value (defect rate, pass rate, revenue) and the engine reverse-solves the optimal value for each variable. One slider move returns an answer in **0.18 seconds**.

③ SHAP Justifier

Every decision automatically carries per-variable contribution and mathematical evidence. Documentation that passes the EU AI Act and Korea's AI Framework Act is issued automatically.

Capability	Regression (BI)	General ML	XimTier
"What influences it?"	✓	✓	✓
"How do we reach the target?"	✗	Limited	✓ Reverse What-If
"Why this decision?"	Manual report	Black box	SHAP auto-attached
On-premise operation	✓	Limited	100% supported
EU AI Act compliance	N/A	✗	✓ Auto-documented

Algorithm validation (simulation) — semiconductor process. Defect rate reverse-solved from **2.40% → 1.20%** across a 12,480-row process dataset, with five process variables computed automatically. Processing time 0.18s, model accuracy 92.4% (R² 0.887), zero data leaving the premises (fully on-prem).
Note: these figures come from algorithm validation on a synthetic dataset, not from a deployed customer engagement. They will be replaced with measured results once the first pilot customer is onboarded.

Market — \$81B TAM by 2030

XimTier does not sit in a single category. Three adjacent markets share the identical customer pain, and together they total \$81B.

Market	2026	2030	CAGR	Source
Decision Intelligence	\$15.6B	\$43.0B	27.6%	Gartner DI Market
Explainable AI	\$10.7B	\$21.0B	18.4%	Markets&Markets XAI
Prescriptive Analytics	\$8.9B	\$17.1B	17.9%	IDC Prescriptive
Total (Bull Case)	\$35.2B	\$81.1B	23.2%	Three-source composite

BASE CASE — \$50.1B. Conservatively sized as a single category, excluding overlap across the three markets. This is the figure we recommend presenting first in VC meetings.

SAM (Korea + APAC) — \$4.9B. Finance, manufacturing and public sector across Korea, Japan and Southeast Asia. The first addressable market at Pre-Seed stage.

Ten Industry Personas — One Engine, Different Variables

The XimTier engine behaves identically across industries; only the variables change. We already have case studies, datasets and demo pages for ten industry personas.

Industry	Persona	Core decision	Headline KPI
Manufacturing	Semiconductor SME — production div.	Defect rate & yield reverse-solve	Defect rate –50%
Hospital	Tertiary hospital — medical IT	Diagnostic support + ops efficiency	Decision time –34%
Public sector	Metropolitan gov. — jobs policy	Policy scenario simulation	Comparison time –70%
Smart city	Integrated ops center	Traffic & energy cross-domain	Scenario compare –82%
Finance	Commercial bank — risk modeling	Automated adverse-action reasons	Dispute handling –62%
Retail	E-commerce BI team	Pricing & promotion ROI, ex-ante	Inventory turns +18%
Logistics	3PL — SCM operations	Last-mile lead time & freight cost	Lead time –1.4h
Energy	Power exchange — supply ops	Peak-load avoidance, renewables uptake	Peak avoidance +24%
Education	Certification edtech	Dropout signal 4 weeks ahead	Dropout detection 84%
Telecom	Mobile carrier — subscriber analytics	Churn prediction + plan simulation	Churn –16%

Why ten? Conventional wisdom says a Pre-Seed SaaS should pick one or two verticals. XimTier's engine is domain-agnostic by construction — swapping the variable definitions covers ten industries with the same codebase. Reaching full deployment within a six-week PoC is the differentiator.

Four Structural Advantages

① The Reverse What-If algorithm

Our proprietary algorithm inverts regression output to derive optimal values per variable. Patent filing in preparation. This is not a thin wrapper over an ML model — it is a dedicated goal-to-variable reverse-optimization engine.

② SHAP-first architecture

SHAP tracing is enforced from the training stage onward. Because it is integrated at design time rather than patched afterwards, the marginal cost is zero. A competitor would have to retrain the model itself to match it.

③ 100% on-premise operation

Zero calls to external Foundation Model APIs. Passes finance, defense and healthcare security policy as-is. Being foundation-model-agnostic means zero exposure to OpenAI or Anthropic pricing and policy changes.

④ Simultaneous KR / JP / EU regulatory fit

EU AI Act Article 6 high-risk requirements, Korea's AI Framework Act, and Korea MFDS medical-device guidance are satisfied together through the same auto-issued document. Regulatory changes are handled by adding items, not rebuilding.

Competitive landscape. Palantir Foundry is an end-to-end enterprise platform with a \$1M+ entry price. C3.ai sells vertical SaaS per industry. XimTier covers ten industries from a single engine with swapped variable definitions — at a Pre-Seed-friendly price point starting at \$800/month.

Go-to-Market and Revenue Model

GTM — NIPA SaaS Express

We hold four cases that qualify for Korea's 2026 NIPA SaaS support program, under which the government covers 80% of PoC cost. A six-week PoC converts to full deployment far faster than the typical six-month SI cycle. Three PoC discussions are currently in progress: a metropolitan government, a certification edtech company, and a mid-sized manufacturer.

Year two — adjacent industry expansion

After securing one finance and one healthcare reference, we enter Japan in 2027 (Tokyo, riding accelerating RPA/AI adoption), followed by Southeast Asia via a Singapore data center.

Plan	Monthly	Target	Key entitlements	Industries
Starter	\$800	SME (5–50 staff)	3 variables · single dataset	1 (manufacturing)
Pro	\$2,400	Mid-market	10 variables · multi-dataset · SHAP reports	3–5
Enterprise	\$8,000+	Large corp. / finance	On-prem · SSO · audit log · dedicated CSM	All
Sovereign	Custom	Public / defense / medical	Fully isolated network · own model training · auto regulatory docs	Bespoke

Unit economics (Pre-Seed assumptions). Pro plan average ACV \$28,800 · CAC \$9,000 (→ \$1,800 with 80% NIPA subsidy) · gross margin 78%. Payback period **4.2 months** with NIPA applied, 11.3 months fully self-funded.

Execution to Date and the 18-Month Roadmap

PRODUCT 21 deploys 36 URLs · KO/EN · live	CASES 10 industries datasets + case pages	CUSTOMER INTERVIEWS 13 3 PoC discussions	TEST COVERAGE 54 / 0 RSpec PASS · CI automated
Quarter	Objective	Milestone	
2026 Q3	Close Pre-Seed	KRW 1.5B · enter NIPA SaaS · publish Korean IR	
2026 Q4	3 paying customers	Manufacturing · public · education on Pro · ARR \$86K	
2027 Q1	Finance reference	1 commercial bank · adverse-action module ships	
2027 Q2	Japan entry prep	Tokyo partner · English IR + 4 EN case studies	
2027 Q3	Seed round	KRW 5.0B · ARR \$500K reached	
2027 Q4	Healthcare reference	1 tertiary hospital · EU AI Act auto-compliance module	

Team — Decision Intelligence Expertise

Il Han — Co-founder & CEO

15 years in SaaS business and B2B go-to-market. Five successful NIPA support-program cases at a previous company. Sales network across finance and the public sector. Personally conducted all 13 customer interviews.

Seungsig Kang — Co-founder & CTO

ML/AI systems engineer. Full-stack developer of the Decision Intelligence engine and architect of the Reverse What-If algorithm. 21 zero-downtime deploys · 54 RSpec tests passing.

Why us. A two-person founding pair covers sales, product, GTM and infrastructure end to end. The reference point is velocity: ten industry personas, 21 deploys and a free beta, all built in six months at Pre-Seed. The next six months are about paid conversion and Japan-entry preparation.

Raising KRW 1.5B Pre-Seed

Use of funds	Share	Amount (KRW)	Key activities
Product development (3 engineers)	42%	630M	Finance module · EU AI Act auto-docs · Japanese UI
GTM (sales + marketing)	25%	380M	NIPA entry · 3 conferences · Japan partner
Customer success (1 CSM)	12%	180M	PoC → full deployment conversion · case library
Infrastructure + security	11%	160M	On-prem packaging · ISO 27001 preparation
Operations + reserve	10%	150M	Legal · accounting · 18-month runway buffer
Total	100%	1,500M	18-month runway → Seed

Next step. A 5-minute demo (live Reverse What-If execution) → 30-minute meeting → PoC alignment → term sheet.
